

Final Exam. EE4371: Data Structures and Algorithms, 2021

- Due by: 30th November, 2021 by 5pm IST.
- To be submitted to the following email address: office.of.gr@gmail.com
- The subject of the email should be: Final Exam: Algorithms, 2021
- Please clearly mention your name and roll number.
- Submit your work as a single pdf file. Additional material, code, etc can/should also be submitted, but there should be atleast 1 pdf, which has the entire assignment.
- Wherever there is code, in the assignments, the code should be well documented and easy to understand / follow.
- Total number of questions: 8. The exam is out of 40 marks. This is a take home exam.

Q1

You are given an array of n elements, and you notice that some of the elements are duplicates; that is, they appear more than once in array. Show how to remove all duplicates from the array in time $O(n \log n)$.

Q2

Given an array A of n integers in the range $[0, n^2 - 1]$, describe a simple method for sorting A in $O(n)$ time.

Q3

Describe a non-recursive algorithm for enumerating all permutations of the numbers $\{1, 2, \dots, n\}$ using an explicit stack.

Q4

Suppose Dijkstra's algorithm is run on the following graph, starting at node A.

- Draw a table showing the intermediate distance values all the nodes at each iteration of the algorithm.
- Show the final shortest-path tree.

Q5

Describe an efficient greedy algorithm in python for making change for a specified value using a minimum number of coins, assuming there are four denominations of coins (called quarters, dimes, nickels, and pennies), with values 25, 10, 5, and 1, respectively.

Q6

Design an efficient algorithm in python for the matrix chain multiplication problem that outputs a fully parenthesized expression for how to multiply the matrices in the chain using the minimum number of operations.

Q7

Algorithms for "Transport Protocols"

- Describe the congestion control algorithms for (a) Cubic TCP, and (b) Compound TCP. Comment on the similarities and the differences between Cubic TCP and Compound TCP.

(ii) What does it mean for a TCP to be fair? And how might one evaluate fairness when TCP operates over a large scale network, like the Internet?

(iii) How might you design the congestion control algorithms of a TCP, where the efficiency (faster download times) and the fairness attributes of your proposal are better than both Cubic and Compound TCP.

Q8

Algorithms for “Search”

(i) Describe the algorithmic components of PageRank, which is the search algorithm used by Google.

(ii) Outline and describe the algorithms used for searching in video sharing sites, like YouTube.

(iii) Describe how you might design a framework for searching on youtube?

Some General Comments

(i) Any code that you present should be well commented, to make it easier to review and evaluate.

(ii) Add plots, where you think it can aid in the understanding of your solution.

(iii) Articulate any assumptions that you may be making, in order to make progress in your solutions.

(iv) Use your discretion to see if your understanding of the problem and any associated solutions may be enhanced via pseudocode, comments, plots, and text which can help explain your thought process to anyone else looking at your work.

(v) Please share the solutions as a pdf file (generated from *jupyter notebook*) as well. Please make it as easy as possible for the reviewer to evaluate your work.
